

ATCS – Compilers and Interpreters (Peer Review Sheet)

Name _____

Date _____ Period _____

Reviewed by _____ Total _____

CodeGen Lab

Focus : Generate executable MIPS code for the given simplified PASCAL program.

Description of check to be performed.	Points/Possible Points
The Emitter is in a package by itself or in the AST package. The package structure for the other files has remained the same.	____ / 4
All method have Javadoc headers including parameters, returns, pre and post conditions and description and it all makes sense.	____ / 8
Statement and Expression have the compile method	____ / 6
All AST Classes have the overridden compile method appropriately.	____ /20
The output files have a .s, .a or .asm extension	____ / 4
The output file has the .data and .text section and a .global main. That is the output asm is well formed.	____ / 6
Variables are declared and are emitted to the .data section	____ / 6
The output asm has a Javadoc header with the author name and date. Note that no purpose/description is expected in the Javadoc header.	____ / 6
The output asm has inline comments like #push (register) #return value in (register) etc	____ / 10
The Emitter class' nextLabelID() method works well and enables successful nesting of statements.	____ /10
Code is structured well, has modularity, does not repeat blocks of code unnecessarily. Check the headers for all the compile	____ / 10
Testing : Works well on parserTest9.txt and on max.txt (Extract from the lab document if you don't have it)	____/10
