

Name _____ Date _____ Period ____ Reviewed by _____

MIPS Lab**Focus :** Simple programs written in MIPS assembly.

Description of check to be performed.	Points/Possible Points
All Programs: Comments include name, date and summary using JavaDoc Standards.	____ / 5
Simple program has some arithmetic operation other than addition. Program to print odd or even has a nice prompt for accepting input from user and has a nice message to display if number is odd or even. Program works well and works with negative numbers.	____ / 8
Program that has a loop that prompts for low and high and step and prints from low to high incrementing by step. Does not get stuck in an infinite loop if low and high are reversed shows error or switches low and high.	____ / 8
Guessing game program has a nice prompt for accepting input from user and has a nice message to display whether guess is wrong and a congratulatory message on correct guess.	____ / 8
Random number generator works and is really random	____ / 6
Array Processing has two separate loops for storing the values and then goes through the elements again to compute min, max etc. Has another unique MIPS program that works well and is NOT as trivial as max of two numbers and print 1 through 10 in a loop. Could be playing music or overflow or anything else.	____ / 6 ____/11
